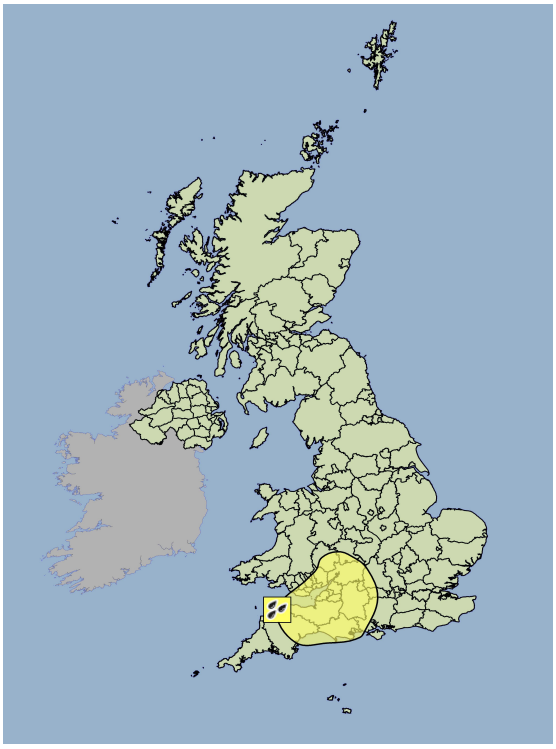
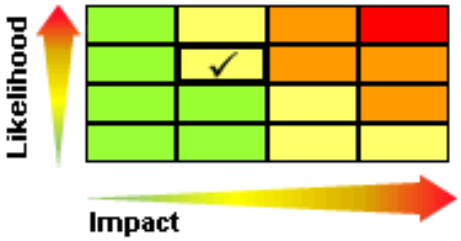
National Severe Weather Warning Service





Chief Forecasters Assessment
A deeply unstable airmass is likely to affect southwest Britain later today associated with a slack area of low pressure over the English Channel. Some locally intense downpours are likely to develop giving 15 mm in less than an hour, and some 30 mm in 3 hours or less. It looks as if the greater risk is across Dorset, Somerset and Wiltshire. However, as often happens in these situations, rainfall amounts could vary markedly, with some areas missing the worst.

The Met Office have issued a **Yellow Warning** of **Rain**

Valid from **14:00 on Thu, 29th May 2014** until **22:00 on Thu, 29th May 2014**

Scattered heavy and locally thundery downpours are likely to develop across parts of southern England, the south Midlands and southeast Wales this afternoon, only slowly easing this evening.

The public should be aware of the risk of surface water flooding.
